

WHAT WE CLAIM ARE:

1. A method of forming a micro pattern comprising steps of:
 - forming a first antireflection film on a surface of an underlying substrate, the first antireflection film suppressing reflection in an absorption
 - 5 mode;
 - forming a second antireflection film on the first antireflection film, the second antireflection film suppressing reflection in a countervailing interference mode;
 - forming a cap film on the second antireflection film;
 - 10 forming a photosensitive resist film on the cap film;
 - forming a latent image in the photosensitive resist film by exposing the photosensitive resist film to light having a first wavelength; and
 - developing the exposed photosensitive resist film.
- 15 2. A method of forming a micro pattern according to claim 1, wherein an attenuation coefficient of the cap film at the first wavelength is smaller than an attenuation coefficient of the second antireflection film at the first wavelength.
3. A method of forming a micro pattern according to claim 1, wherein an
- 20 attenuation coefficient of the cap film at the first wavelength is 0.
4. A method of forming a micro pattern according to claim 1, wherein an attenuation coefficient of the first antireflection film is 1 or higher at the first wavelength.

25

5. A method of forming a micro pattern according to claim 1, wherein an attenuation coefficient of the second antireflection film is 0.9 or lower at the first wavelength.

- 5 6. A method of manufacturing a semiconductor device comprising steps of:
- forming an interlayer insulating film on a surface of a substrate having an insulating surface, formed with semiconductor elements, and having a conductive member exposed in a partial area of the insulating surface;
 - forming a first antireflection film having a first attenuation coefficient
 - 10 on the interlayer insulating film;
 - forming a second antireflection film having a second attenuation coefficient smaller than the first attenuation coefficient on the first antireflection film;
 - forming a cap film on the second antireflection film;
 - 15 forming a first photosensitive resist film on the cap film;
 - exposing the first photosensitive resist film to light of a first wavelength, developing the exposed first photosensitive film to form an opening through the first photosensitive resist film; and
 - etching the interlayer insulating film by using the first photosensitive
 - 20 resist film as a mask.

7. A method of manufacturing a semiconductor device according to claim 6, wherein an attenuation coefficient of the cap film at the first wavelength is smaller than the second attenuation coefficient of the second antireflection film at the first
- 25 wavelength.

8. A method of manufacturing a semiconductor device according to claim 6,
wherein an attenuation coefficient of the cap film at the first wavelength is 0.
- 5 9. A method of manufacturing a semiconductor device according to claim 6,
wherein the first attenuation coefficient of the first antireflection film is 1 or higher
at the first wavelength.
10. A method of manufacturing a semiconductor device according to claim 6,
10 wherein the second attenuation coefficient of the second antireflection film is 0.9
or lower at the first wavelength.
11. A method of manufacturing a semiconductor device comprising steps of:
- forming an interlayer insulating film on a surface of a substrate
- 15 having an insulating surface, formed with semiconductor elements, and having a
conductive member exposed in a partial area of the insulating surface;
- forming a first antireflection film on the interlayer insulating film, the
first antireflection film suppressing reflection in an absorption mode;
- forming a second antireflection film on the first antireflection film,
- 20 the second antireflection film suppressing reflection in a countervailing
interference mode;
- forming a cap film on the second antireflection film;
- forming a first photosensitive resist film on the cap film;
- exposing the first photosensitive resist film to light of a first
- 25 wavelength, developing the exposed film to form an opening through the first

photosensitive resist film, the opening corresponding to a via hole for connecting a wiring pattern to be formed on the interlayer insulating film to the conductive member;

- 5 etching the interlayer insulating film to form the via hole by using
the first photosensitive resist film as a mask;
removing the first photosensitive resist film;
forming a second photosensitive resist film on the cap film;
exposing the second photosensitive resist film to light of the first
wavelength, developing the exposed film to form an opening through the second
10 photosensitive resist film, the opening corresponding to the wiring pattern to be
formed on the interlayer insulating film;

- etching the interlayer insulating film to form a wiring groove by
using the second photosensitive resist film as a mask, the wiring groove reaching
a midst of the interlayer insulating film in a thickness direction thereof;
15 removing the second photosensitive resist film;
 deepening the via hole until the conductive member is exposed if
the conductive member is not exposed on a bottom of the via hole; and
 burying an inside of the via hole and the wiring groove with a
conductive wiring material.

20

12. A method of manufacturing a semiconductor device according to claim 11,
wherein an attenuation coefficient of the cap film at the first wavelength is smaller
than an attenuation coefficient of the second antireflection film at the first
wavelength.

25

13. A method of manufacturing a semiconductor device according to claim 11,
wherein an attenuation coefficient of the cap film at the first wavelength is 0.

14. A method of manufacturing a semiconductor device according to claim 11,
5 wherein an attenuation coefficient of the first antireflection film is 1 or higher at
the first wavelength.

15. A method of manufacturing a semiconductor device according to claim 11,
wherein an attenuation coefficient of the second antireflection film is 0.9 or lower
10 at the first wavelength.
